3/3

Which operator is used to check if two values are equal and of same data type?

- ☐ ==
- ☒ ===
- ☐ data_equals()
- ☐ none

Answer: ===

Explanation: == Simply checks if values are equal. === checks if both values and datatypes are equal. So, if \$a = 2 and \$b = "2", then \$a == \$b will be true as both have value 2 but \$a=== \$b will be false as one is an integer and other is a string!

Q. What is the difference between print and echo?

Echo and print are more or less the same. They are both used to output data to the screen. The difference is echo has no return value while print has a return value of 1 so it can be used in expressions. print can just print one variable, while echo can print multiple variables separated by a comma (,) in the syntax.
